DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING MOBILE APPLICATION DEVELOPMENT LABORATORY

CLASS/SEM: III / V

DATE: 19/06/2026

STUDENT NAME: **KAMALIKA V**

Project Title: SHADOW- DIGITAL IDENTITY RISK SCANNER

Abstract:

The rapid growth of online platforms and social media applications has increased the risk of digital identity exposure and cyber threats. Many users are unaware that their personal information such as email addresses, passwords, profile images, and sensitive data can be leaked, misused, or exposed online through data breaches, fake profiles, phishing links, and privacy vulnerabilities.

To address this issue, the proposed project “**Shadow-Digital Identity Risk Scanner**” is developed as a mobile application that helps users monitor and protect their digital identity using AI-based risk analysis. The application can detect email breaches, identify suspicious or fake profiles, analyze privacy exposure, scan scam links, and generate a Digital Identity Safety Score based on the user’s online security level. The system also includes a Screenshot Privacy Analyzer that warns users when sensitive information such as OTPs, bank details, or personal data are detected in screenshots.

Features:

- Digital Identity Safety Score Generation
- Email Breach Detection
- Scam Link Detection
- Screenshot Privacy Analysis using OCR
- Fake Profile Detection

Plan For Next Week (26/06/2026):

- Design the application workflow and module architecture.
- Set up Flutter, Android Studio, Python, and MongoDB environment.
